

Developer Guide

Architecture and local setup for Stockora AI.

Project structure

shop/ contains shop workflows; admin/ contains platform operations; includes/ contains config, helpers, and shared layouts.

Local environment

Import database.sql, configure includes/config.php, start Apache/MySQL, and visit BASE_URL.

Secure Feature Development

Extend Stockora AI without breaking tenant isolation.

Stockora AI

Point of Sale

Sales

Analytics

Protected Shop Page

Search, manage, and track your business from one workspace

Sales Today

Rs. 48,250

Low Stock

07 Items

Profit

Rs. 12,480

Live data and reports update from your recorded transactions.

Authorization

Call `requireShop()` or `requireAdmin()` before output. Premium pages must check `requirePremiumFeature()`.

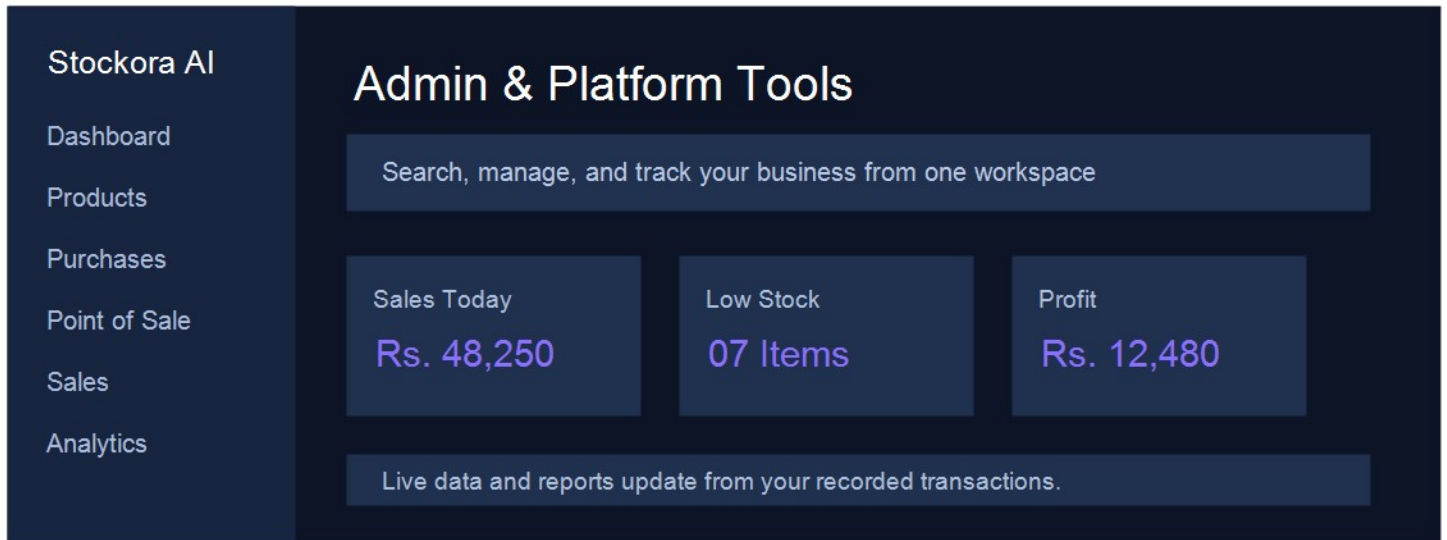

Data boundary

Scope every tenant-owned query to the active session `shop_id`. Use PDO prepared statements and transactions for multi-record operations.

Release Checklist

Quality, security, and production handoff.

API and styling

Validate API session/request data, return consistent JSON, and reuse shared CSS variables and layouts.

Before deployment

Back up MySQL and assets/uploads, set production configuration, test login/POS/invoice, and enable safe logging.
